## SPORTS COMMERCIAL PILOTED EXPEDITIONS TO MARS, VENUS, MERCURY AND OTHER PLANETS AND THEIR SATELLITES.

### **Abstract**

Private expeditions to conquer new lands or new peaks are common in human history. Joshua Slokam, Amundsen, Scott and others made a great contribution to the study of human capabilities in extreme situations and made discoveries in the sports competition mode. The competition of individuals from different countries among themselves is not so extreme when there are extreme races between the leaders of the countries :) At present, technologies and experience in space activities accumulated by the efforts of great engineers at the expense of taxpayers in the last century makes it possible to make a number of space travels for little money by efforts of private individuals right now. This report will focus on commercial travels to the Moon, Mars, Venus and Mercury, which the author designs and prepares for possible implementation over the next 8 years. So, cheap scientific and sports commercial expeditions to other planets are no longer a fantasy, but an absolutely clear concept, as the concepts in this report will show. The main focus will be on the lightweight Manned Expedition to Mars, which the author of the report intends to implement, with sufficient funding, by 2024.
